

## Vi-Aqua Products

The effects of Vi-Aqua on plant life.

"Vi-Aqua" is an organic plant growth enhancement system which can show **VISIBLE, TANGIBLE and QUANTIFIABLE** proof that Vi-Aqua can increase plant growth by as much as 25%.

Extensive field tests have been conducted on Vi-Aqua, to further understand the technology. With Vi-Aqua you will notice a marked improvement in plant growth and crop yield.

This is not a fertilizer in the traditional sense; we add nothing to the water except natural energy. Amongst other effects, Vi-Aqua stimulates photosynthesis. **How Vi-Aqua Works**

Using a radio frequency wave of 27MHz, Vi-Aqua transmits a safe electrical energy into water which enhances the performance of nutrient uptake.

In most cases it stimulates photosynthesis converting those essential nutrients into energy. This unique technology is patented worldwide.

Vi-Aqua works by altering the configuration of hydrogen in water.

It influences the critical structure of hydrogen in suspension by producing greater availability of Oxides, Peroxides and Super Oxides.

Further to this process Vi-Aqua reduces the surface tension of water producing more available solute in solution which in turn makes nutrients more presentable to plant life.

The products are targeted at specific markets, based on the volumes of water required. Each one operates and delivers results in the same way, whether in areas of soft or hard water. **Benefits of Vi-Aqua**

Our products operate and deliver results in exactly the same way, whether in areas of soft or hard water. There are 5 main key benefits.

- Growth
- Vi-Aqua treated WET water stimulates root formation and penetration for a stronger plant. It has proven to be particularly effective in shaded locations and in winter. Plants are more resilient to damage, they exhibit quicker structural recovery and have an improved disease resistance.
- Results and Appearance
- Turfgrass will have a more lush appearance, as well as being stronger. Crop yields can be improved by up to 40% which means increased profits.
- Fertiliser Reduction
- Vi-Aqua WET enhances the "wetting effect" of water, but with no added substances of any kind. When used with fertiliser, Vi-Aqua WET compounds its growth effects by making it more soluble, increasing the uptake of nutrients.
- Low Running Costs
- Not only do you save money on fertilisers, but the day to day running costs are exceptionally low. Once the equipment has been installed, it runs on 3 amps (a regular domestic appliance uses 13 amps) and uses 8watts of power per hour (a regular light bulb uses between 60 and 100 watts)
- Kinder to the Environment
- The Vi-Aqua WET treatment is an entirely natural process, with no chemicals involved. The treatment also absorbs greater amounts of CO<sub>2</sub>, thereby reducing the Greenhouse Effect. Greater amounts of Nitrogen are also absorbed, reducing Nitrogen run-off into the water table.
