Pireco - Plant louse, white fly & red spider mite - Capsuals 40

Price per Unit (piece): 10.95 Euro

Plant louse, White fly and red spider mite Composition: Pireco against plant louse, white fly and red spider mite is a highly concentrated, liquid composition of specifically working herbal extracts based on water and soybean oil. Effects: The root and the leaf of the plant, shrub or tree will absorb Pireco. By this absorption, taste as well as smell of the plant and soil will change (perceptible only by these insects). This will stop them from eating as a result of which they will die from starvation. This way the inconvenience and damage will disappear. Pireco should be applied from the moment when the plant, shrub or tree starts to sprout. If there has been a lot of inconvenience and damage in the past, a preventive treatment is recommended. Pireco has a residual effect of four to six weeks, after which a next treatment might be necessary (depends on insects which are still present or which are to be expected). Application: Pireco can be applied in a pleasure garden, vegetable garden and on terrace or balcony by means of pouring, soil treatment or spraying (see administering). The taste of eatable plants will not change and they can be consumed as usual. Administering: Pouring; Dissolve 100ml Pireco in 10 litres of water (use 5 litres of the dilution for 25 m²) Preferably loosen up the surface soil. After that pour with a lot of water (10mm) Soil treatment; Dissolve 100ml Pireco in 5 litres of water and apply in the soil at the hair-roots of the plant, shrub, or tree. Make little holes, for example with a stick, depth of approx. 15cm (10 holes per m² root surface) Pour approx 25 ml of the dilution in each hole and then close the holes. Spraying; Dissolve 10 ml Pireco in 0.5 litres of water. Spray the dilution on the leaves of the plant, shrub or tree in such a way that they become well damp. It is important that also the bottom side of the leaves are treated. Do NOT apply this method in bright sunlight and at temperature of more than 25 degrees C.
